Proof That There Is No Largest Prime Number

A proof using reductio ad absurdum.

Theorem

There is no largest prime number.

Proof.

- 1 Suppose *p* were the largest prime number.
- 2 Let $q := 1 + \prod_{i=1}^{p} i = 1 + p!$.
- Then q is not divisible by any $p' \in \{1, ..., p\}$
- 4 Thus q > p is also prime.
